

**IN THE SPECIFICATION:**

**Please replace paragraph 2 at page 10 continuing onto page 11, with the following rewritten paragraph:**

Based on a monitor output control signal CMT from the later-described control portion 50, the monitor image signal generation portion 41 generates an image signal DVp (not shown) that displays an image based on the image signal DVb' and an image based on the image signal DVr' on one screen. Furthermore, the monitor image signal generation portion 41 selects either one of the image signals DVb' and DVr' and the thus generated image signal DVp and supplies it as a monitor image signal DMTout to the electronic viewfinder or the monitor device. Further, to output an analog signal, a D/A conversion portion 42 can convert the monitor image signal DMTout into an analog monitor image signal SMTout and output it.
